

SNOWFLAKE AIM

**AI-DRIVEN MODERNIZATION AND VIRTUALIZATION
FOR YOUR DATA ECOSYSTEM ON SNOWFLAKE**

June 2026

Snowflake AIM - Migration Suite

AI-driven modernization and virtualization for your data ecosystem on Snowflake

VIRTUALIZATION

RUN TERADATA ON SNOWFLAKE WITHOUT REWRITING

Escape renewal pressure without a risky rewrite

Eliminate rewrite risk — keep applications running

Protect mission-critical operations with zero downtime

Modernize faster and turn migration into AI-driven value

MODERNIZATION

MIGRATE DATA WAREHOUSES TO SNOWFLAKE

Convert code and database objects from leading data warehouses

Support tables, views, stored procedures and more

End-to-end migration for SQL Server and Amazon Redshift

Automatic translation of legacy ETL workflows into dbt in Snowflake

MIGRATE AND MODERNIZE SPARK WORKLOADS

Analyze Python, Java or Scala-based Spark code to identify APIs and patterns

Assess compatibility with Snowpark and Snowpark Connect

Generate automated conversions to Snowpark equivalents

SNOWFLAKE AIM MIGRATION AGENT

AI-powered code understanding, translation and migration intelligence across Snowflake AIM modernization workflows

Deploy to Snowflake Native and Managed Iceberg Tables

SUPPORTED SOURCES

ORACLE

SQL SERVER

TERADATA

AWS

REDSHIFT

GOOGLE
BIGQUERY

GREENPLUM

SYBASE

SYNAPSE

NETEZZA

POSTGRES SQL

DATABRICKS SQL

SNOWFLAKE AIM FOR VIRTUALIZATION

Datometry Is Now Snowflake AIM for Virtualization

AIM-V is the Snowflake-productized form of Datometry / Hyper-Q

Snowflake AIM for Virtualization

Exit Teradata fast — without rewrites, downtime, or lock-in

KEY BUSINESS OUTCOMES

-  **ESCAPE RENEWAL PRESSURE**
Avoid long-term Teradata contracts and cost escalations
-  **ELIMINATE REWRITE RISK**
Run existing applications and tools unchanged
-  **PROTECT OPERATIONS & CONTINUITY**
Zero downtime and business continuity
-  **MODERNIZE ON YOUR TERMS**
Lift and shift now, modernize in phases

Shut down Teradata now. Modernize later. On your timeline.

Reference Architecture

Deployment and Pricing

Deployment Architecture

Deployment in 5 Steps

- 1 Analyze** — Assess Teradata schema and query logs for compatibility.
- 2 Synchronize** — Move initial schemas and data into Snowflake.
- 3 Repoint** — Update JDBC / ODBC connection strings to the AIM-V endpoint.
- 4 Verify** — Dual-run testing to confirm result parity.
- 5 Transition** — Cut over production traffic and decommission Teradata.

Infra: 2 x 32/64 core VM, 500GB SSD, Red Hat Linux 8.x or 9.x compatible • Ports 1025 (clients) · 22 (operators) • Scales vertically and horizontally

Availability: GA, but offered to select customers only. Not available in government / VPS deployments requiring FedRAMP or similar certifications.

Virtualization Use-cases for Snowflake AIM

Customer considerations

**12–18 months runway
to Teradata Renewal**

**Fear of Business
Disruption**

**Application
dependencies/
Inability to decouple**

**Mission Critical
Applications**

(Finance, HIPAA, SOC, Gov etc)

**Insufficient budget
for modernization
and migration**

**Custom Applications
and Tooling**

Simplify End-to-End Database Migration With AI

Guide, convert, migrate, and validate—all in one Snowflake CoCo Agent

WHAT IS IT

An AI-powered migration agent in Snowflake CoCo that walks you through the entire migration lifecycle—from source connection to deployment, data migration, and validation.

WHY USE IT

End-to-End Automation: Covers connect → convert → assess → migrate → validate in one guided flow.

AI-Assisted Conversion: Explains issues, suggests fixes, and improves code interactively.

Progress Without Restarting: Tracks state and resumes long migrations seamlessly.

HOW TO USE IT

1. Launch Snowflake CoCo→ run **migrate**
2. Follow guided stages: connect, convert, assess, migrate
3. Jump to any step or resume automatically

How Snowflake AIM Helps You Modernize

Understand Migration Complexity With AI-Powered Assessment

Analyze source systems and generate a clear migration plan

WHAT IS IT

An AI-powered assessment in the Snowflake AIM Migration Agent that analyzes source database code and generates a comprehensive, dependency-aware migration report. Available for SQL Server, Redshift, and source Apache Spark platforms.

WHY USE IT

Clear Migration Plan: Organizes objects into dependency-aware waves for structured deployment.

Risk Identification: Highlights complex areas like dynamic SQL, unused objects, ETL workloads, and Spark compatibility gaps.

Effort Reduction: Identifies exclusions and optimization opportunities to reduce migration scope.

HOW TO USE IT

1. Run the migration skill in Snowflake CoCo and ask for assessment
2. Generate and review the interactive HTML report
3. Use insights to plan and execute migration

Migration Assessment Overview

This assessment analyzes the workload for migration to Snowflake. It breaks down the code inventory, estimates conversion effort, and identifies dependencies for a wave-based deployment.

Section B How to Use This Report

1

Dependencies Report

Goal: Understand dependencies and plan deployment.

View comprehensive object inventory, dependency statistics, and migration wave planning.

2

Exclusion Report

Goal: Reduce scope. Identify objects that may not need to be migrated, such as temporary, deprecated, testing, and duplicate objects.

3

Dynamic SQL Report

Goal: Fix runtime issues. Deep dive into complex code patterns (Dynamic SQL, Linked Servers) that SnowConvert cannot statically analyze.

4

SSIS Report

Goal: Assess ETL pipelines. Analyze SSIS packages to understand data flow complexity, identify unsupported components, and plan ETL migration.

What you can do

The skill guides you through the full migration lifecycle and lets you jump directly to any stage at any time.

[link](#) **Connect to source**

Set up a connection to your source database with credentials stored securely for reuse

[code_download](#) **Extract source code**

Pull DDL and stored procedures directly from a live database, or import local .sql files

[transform](#) **Convert code**

Translate source SQL to Snowflake-compatible SQL via SnowConvert, with a full EWI report

[last_mile_convert](#) **AI-assisted conversion**

AI explains remaining conversion issues, suggests fixes, and applies them interactively

[plan_migration](#) **Assess Workloads**

Interactive HTML report covering deployment waves, object exclusions, and ETL analysis

[publish](#) **Deploy objects**

Deploy converted tables, views, functions, and procedures to Snowflake wave by wave

[move_data](#) **Migrate & validate data**

Copy rows from source tables to Snowflake with automatic row-count validation

[equivalence_check](#) **Test functions & procs**

Capture source-side baselines and run validation to confirm output equivalence

[learn_and_fix](#) **Learn & apply fix rules**

Create reusable fix rules from corrections and propagate them across the project

[repoint_tool](#) **Repoint reports**

Repoint Power BI reports to use Snowflake as the primary data source
